Case Study

Smart University Internship & Project Management System

A university intends to develop a Smart University Internship & Project Management System to manage internships and final-year capstone projects of undergraduate students. Currently, the process is manual and involves significant paperwork, delays, and lack of transparency.

In the proposed system, students must log in using their university credentials and register either for an internship or a capstone project during their final year. Based on university regulations, students may opt for different credit structures, each having a minimum duration requirement. While registering, students are required to provide organization details and upload supporting documents such as offer letters and project proposals.

Once a student submits the registration, the details are reviewed by a faculty guide assigned by the department. The faculty guide verifies the relevance of the internship or project to the student's academic program and may either approve the registration or request modifications. In some cases, the faculty guide may provide remarks or feedback for resubmission.

For internships, the system must ensure that the organization is legitimate. Hence, the internship details are further verified by a department-level coordinator, who checks company credentials and validates whether the internship duration satisfies the selected credit requirement. If any discrepancy is found, the coordinator may reject the application or forward it for special approval.

During the internship or project period, students are required to submit periodic progress reports through the system. These reports are reviewed by the faculty guide, who provides feedback and tracks the student's progress. Additionally, for internships, an external industry mentor from the organization confirms student attendance and submits periodic performance evaluations through the system.

In certain situations, students may be unable to complete the internship within the originally approved duration due to valid reasons. In such cases, the system allows students to apply for an extension, which undergoes an additional approval process. Exceptional cases such as late registration, credit deviations, or policy violations are escalated to higher academic authorities for decision-making.

At the end of the internship or project, students must upload a final report and presentation. The faculty guide evaluates the submission, and the industry mentor (in case of internships) provides final feedback. Based on all evaluations, final grades are assigned and stored in the university academic system.

The system should also allow authorized academic administrators to configure academic rules, monitor overall internship and project statistics, and generate reports for accreditation and compliance purposes.
